The prosecution of this case is closed except for consideration of the above matter.

***Conclusion***

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

US 6,160,388, "Sensing of current in a synchronous-buck power stage" issued to Skelton et al., 12-12-2000 teaches a DC-DC converter circuitry, in which transistors 101 and 102 (fig. 1) receive drive signals from a dead time control circuit (107, fig. 1) based

upon a pulse width modulated (PWM), or Vcont signal, the transistors 101 and 102 buffer the control signals. An input DC voltage Vin is chopped by the transistors 101 and 102 into a square wave and appears at node 105 (fig. 1). This voltage then passes through a low pass filter (constituted by 103 and 104) and becomes a lower voltage Vout.

This circuitry shown in fig. 1 is more or less like that by the instant application. However, the Vout is converted from a Vin, and is not from the Vcont, which is a PWM control signal.
